Jasleen Kalsi

Gina Givens

Sara Huang

Ruixin Yang

1. What would a successful project look like? Identify a small set of concrete goals and how you will assess them. Consider whether the dashboard answers your research questions, uses appropriately prepared data, presents accurate and interpretable analyses, and is accessible and easy to navigate. What checks will you use to evaluate data quality, dashboard functionality, and the clarity of your findings? Distinguish essential deliverables from optional features. What would a successful project look like? Identify a small set of concrete goals and how you will assess them. Consider whether the dashboard answers your research questions, uses appropriately prepared data, presents accurate and interpretable analyses, and is accessible and easy to navigate. What checks will you use to evaluate data quality, dashboard functionality, and the clarity of your findings? Distinguish essential deliverables from optional features. We hope to have a better understanding of white-tailed deer populations and how they are affected by habitat fragmentation. Our research question is are white-tailed deer observations more common near developed areas that border wildland vegetation? We are all interested in wildlife interactions with human development, particularly fragmented habitats. Our audience is land developers, policy makers, and land conservancies. They can expect that our project will be well-thought out and be illustrative of population dynamics and resiliency.

2. We made a groupchat on imessage to communicate. Additionally, email and dukebox. We will promise to respond on the same day, and make sure to not message each other too late at night. We will meet on Thursday every week. We can adapt as necessary to meet outside of class. We will make a to-do list after each class where each of our members sign up for a task or two.

3. We are all interested in how fragmentation is affecting wildlife. Sara has experience making figures on R, Gina and I have fieldwork experience with wildlife, and Ruixin has experience observing habitat change as well as modeling in R. We want to gain better modeling skills in R relating to spatial datasets like WUI. The division of responsibilities will be decided based on the strengths and capabilities of teammates. It will more than likely change as the project grows, but initially, our team will have a shared responsibility for all tasks. At each Thursday meeting, we will decide on tasks and organize them. We can regularly check in with each

4. We will schedule the meeting time, decide the meeting topics, and pick the meeting location (including on-line) at least 24 hours in advance outside of the regular class meeting period. We will assign the tasks on Thursdays and keep checking in with others throughout the week. When working independently, we first try to complete the task ourselves. If there are problems, we will message one another and depend on how easy the solution is. We will help each other out directly or hold a meeting and solve it together. If someone anticipates missing a meeting or deadline, she will send a notification within 24 hours or as soon as possible in case of an emergency. We will all agree on the documents before submission.

5. A good teammate will be respectful of others' opinions, respond to and finish tasks on time, and assist other team members when they have trouble. We will ensure that everyone has the opportunity to participate through regular communication and constructive feedback (through group chat and in-person meetings). If there are issues such as uneven work distribution or problems with work quality, we will communicate promptly and jointly seek solutions instead of blaming each other.

6. We will use the internet, previous lab assignments, and ask the TAs for help. I think we will have enough data to complete this assignment. Some other constraints for completing this project are health issues coming up and people not being able to finish their tasks, problems with data cleaning and processing, having to use different data, and figuring out how to convert spatial data into R.

7. We will make decisions based on available data that is both applicable and accurate. We will make decisions mutually and by looking at all available options. All teammates will be directly involved in data making decisions, and all evidence will be presented with each other. Together as a team, we will look through available data and decide upon it mutually. If this cannot be done on Thursdays, we will check in which each other via text or email to present/discuss decisions. If we cannot reach a consensus, we will discuss all considerations and listen to all teammates perspectives fairly to ensure everyone has had an opportunity to express their concerns/ideas and can elaborate as to why. We will seek guidance from an instructor or a TA when we feel that we could not solve the issue through collaboration. Our team will be the first line of defense, and then we will reach out to a TA and then instructor.

8. A successful project will have smooth teamwork and satisfactory results from the data. We will (1) find related data and manipulate it into a data frame, (2) make good visualization of our findings to answer our core question of the project, and (3) present the data to the audience.

9. :

- Defining research questions and project scope.
    - Weeks 1 and 2
- Assessing data feasibility
    - Weeks 1 and 2
- Preparing and combining datasets.
    - By the beginning of the second week
- Conducting exploratory analysis.
    - Weeks 3-4
- Building a dashboard prototype.
    - Weeks 4-5
- Reviewing and testing the dashboard.
    - Weeks 4-5
- Preparing the final presentation.
    - Weeks 5-6

We are each responsible for the milestones listed, and each week we will divide subtasks per teammate
